

HisabDo — Day 13 User Experience Review

Capstone Project | Track: Software Quality Assurance

Tester: Mohamed Hany — Junior Software Tester (ISTQB CTFL v4)

Date: August 13, 2026

1. Review Scope

This UX review is based on the Day 13 manual execution of authentication, registration, session handling, navigation, validation, and related usability scenarios for the HisabDo Android application and website.

2. UX Findings

Area	Assessment
Area	Assessment
Authentication	Login and sign-in flows are understandable and respond correctly to valid and invalid inputs. Password visibility behavior worked as expected.
Registration	Registration scenarios passed, including empty fields, invalid formats, duplicate account handling, and password confirmation validation.
Session Handling	Background/foreground and sign-out scenarios behaved as expected during execution.
Navigation	Navigation and cancel/back flows worked without crashes or unexpected states in the tested scenarios.
Validation & Error Handling	Required-field and invalid-format validation worked. Authentication errors were handled without leaving the user in a broken signed-in state.
Overall UX	The tested authentication and navigation flows were generally clear and usable, with two important issues affecting security/account recovery.

3. UX Issues Identified

BUG_001: PIN/biometric lock was not available. This reduces the app's available protection for users who expect an app-level security option.

BUG_002: The forgotten-password reset flow could not be completed because the reset link could not be reached. This can prevent users from recovering access to their account.

4. Overall UX Assessment

Overall Result: Needs Improvement — The tested login, registration, validation, session, and navigation flows were mostly successful. However, the two High-severity authentication/security defects should be addressed before considering the authentication experience fully reliable.
